Red to Green ("R/G")

The Red to Green move has several different names, but they all represent the same trading pattern¹. When the stock breaks out from a high of the day² or is going from being down on the day to positive on the day, that is where you get the R/G move (the stock went down from a certain point and came back up to revisit the price, thus breaking out).

What should you be looking for when it comes to a red to green move? Well, the thought process is simple: up until it breaks out of upper resistance³ on the day, the bears⁴ are in complete control of the stock. When buying pressure⁵ comes in sending this stock higher that is where the bulls⁶ step in and regain control sending the stock higher.

\$ZSAN (\$2.25 to \$2.50, \$2.50 to \$3.00, \$3.00 to \$3.50) 55.56% Gain

\$ZSAN is the perfect example of how you can use the same pattern multiple times within the same day. As you look at this chart you can see it breakout not once,

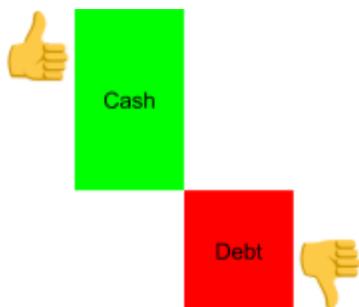

- ¹ Trading pattern - A pattern formed throughout the market that has been proven to return similar results consistently
- ² High of the day ("HOD") - The highest price a stock has reached within the day
- ³ Resistance - A price level that a stock struggles to hold ((1) on the chart above)
- ⁴ Bears - Those who believe a stock is going to decrease in value
- ⁵ Buying pressure - Larger buy orders coming in from those looking for the stock to increase in value
- ⁶ Bulls - Those who believe a stock is going to increase in value

not twice but three times in total, so whether you locked in profits on each move which is the safe thing to do or held for the big time movement, then you still won on the day! Each red to green breakout occurred as long as you were watching the chart pattern. \$2.25 to \$2.50, \$2.50 to \$3.00 and then the last one, which took some time to develop from \$3.00 to \$3.50. \$ZSAN was a very tricky stock to trade as many shorts thought this would be coming down. What you have to realize is no single indicator can control the move of a stock. If that stock is holding support, increasing on a bullish trend line and also breaking out of resistance on an R/G move one must realize that the bulls are in control and should not be shorting. I know many people who lost thousands on this short play while they should have been long. Ask yourself this, "if you are in Spain for the running of the bulls would you jump in the middle of the street with 200 bulls charging at you hoping to stop the move?" The answer should be no. Never be fooled into thinking one signal indicator should determine the direction; bullish or bearish. You need to constantly be improving and continually adapting to what the market is bringing you.

Cash on Hand & Debt

Lastly, cash on hand and current debt go nearly hand in hand. In general, companies are only profitable and able to stay in business when they are making money. If a company is cash heavy that is very good for the future growth of the company. However, if that company is cash-stricken, it could spell disaster in the future because they could be looking to raise capital through dilution⁷ or financing⁸. We know that the general definition of “debt” is something that is owed or due.

So, if one was to look at the quick statistics and see that the debt to cash ratio was weighted heavily in the red, this should raise the alarm. Whenever you are analyzing a trade, remember that a company with more cash and less debt (\$0 is the best case) usually has the best chance of holding gains on the day and continuing its run. Many companies with large amounts of debt that spike will instantly be met with massive selling and shorting because many investors are already anticipating the price will go down, or the company will be doing some financing. On a side note, never assume that a stock with a large cash surplus and \$0 in debt will not do financing. If a stock has had a massive breakout and even if they do have significant cash on hand, many times they will dilute to fund future operations and growth.

⁷ Dilution - A company's release of more shares in order to raise cash, diluting existing shareholders' % ownership in the company

⁸ Financing - Similar to dilution, a company often sells more shares in order to raise capital from investors
